

Sand: post-hoc tradeoffs in the saved test artifacts

- 11 adaptive test configurations
- Fixed MSE, $r=0.015$
- Fixed legacy NLL, $r=0.015$
- ★ Configuration chosen in paper
- ▲ Fixed MSE, $r=0.019$

(a) MSE at step 200

(b) Mean MSE over 314 steps

Post-hoc test-artifact display, not validation-only tuning or a new hyperparameter selection. Both axes include zero.

Realized edge counts use different predicted geometries; they are not equal-state compute budgets. No seed uncertainty is available.
